

SDT

Self Development Tracker

From a local single-user tracker to a cloud-hosted multi-user product.

- BA CASE STUDY
- FULL-STACK
- CLOUD V2

A Technical Business Analyst case study in change management, architecture migration, production UAT and release delivery.

V1 solved the workflow. V2 solved the adoption barrier.

Post-release use turned a working local product into a defined change programme.

V1 BASELINE

Working — but local

SDT
Self Development Tracker

ACTIVE CHALLENGE
30-Medium
Aug 20, 2026 – Sep 18, 2026

30 days · 4 rules · 2 strikes per rule [Progress Report](#) [End Challenge](#) August 2026 Today

Overall challenge progress
13% complete 4/30 days completed

Node.js + Express + SQL Server

Testers still needed local setup before they could try it.

POST-RELEASE FEEDBACK

The friction was not the core feature set.

- Installation blocked casual testing
- No identity or user ownership
- Mobile use needed refinement
- Completed challenges were hard to revisit
- Daily reflection had no place

V2 RESPONSE

Remove setup. Add trust.

- Public cloud access
- Supabase Authentication
- RLS-backed user isolation
- Responsive mobile UI
- Challenge History
- Daily Notes

Result: a product other people can open, sign up for and use.

02 • CHANGE MANAGEMENT

Four change requests defined the V2 scope.

Each enhancement had a business reason, priority and acceptance path — not just a feature idea.

CR-001

CRITICAL

Cloud Deployment & Multi-User Access
Remove installation friction and introduce secure ownership.

CR-002

HIGH

Mobile-Responsive Interface
Make daily tracking practical on phone-sized screens.

CR-003

HIGH

Challenge History
Keep completed challenges and final reports accessible.

CR-004

MEDIUM

Daily Notes / Remarks
Capture context alongside a recorded challenge day.

03 • SOLUTION DESIGN

CR-001 required an architecture migration — not just a deployment.

V2 adds identity, authenticated API access and database-level ownership controls.

04 • PRODUCT EXPERIENCE

The core challenge workflow stayed familiar — the experience around it matured.

Authentication, cloud persistence and responsive access were added without rewriting the core business rules.

Authenticate

Create an account, confirm email and sign in.

Track

Calendar + Today shortcut opens the daily record.

Review

Progress, strikes, reports and history remain visible.

Continue

Cloud data persists across sessions and devices.

05 • V2 ENHANCEMENTS

Three usability changes made the product easier to use every day.

CR-002 to CR-004 extend the experience without changing the underlying challenge lifecycle.

CR-002

Mobile-ready daily use

Compact 7-column calendar fits an iPhone16 (393×852px) viewport.

CR-003

Challenge History

Completed challenges retain details and access to final reports.

CR-004

Daily Notes

Optional context is stored with the recorded day and carried into reports.

Multi-user access is enforced through both application logic and the database.

Ownership begins with the authenticated user and flows through the challenge data model.

Daily records become evidence — not just a calendar tick.

The final report summarises completion, strikes, rule performance and day-level notes from the same underlying records.

What the report answers

- How much of the challenge was recorded?
- How many days were perfect?
- Which rule was strongest / weakest?
- How many strikes were used?
- What happened on each recorded day?
- What context did the user write down?

PRINT-FRIENDLY

FINAL REPORT

Acceptance happened in production.

The UAT pack traced the V2 change set through functional, regression, lifecycle and responsive tests.

25

TEST CASES

25

PASSED

0

FAILED

0

BLOCKED

Coverage

- Authentication + session persistence
- Challenge lifecycle + daily tracking
- Progress, strikes + reporting
- History + notes
- Mobile responsiveness + desktop regression

KEY EVIDENCE

Two production users created and retained separate challenge data.

Neither user could access the other user’s active challenge, history, notes or reports.

CR-001 → CR-004 • UAT PASSED • CLOSED

The V2 lifecycle ends with a production baseline — not just “code complete”.

Documentation, acceptance and release were treated as part of delivery.

SDT V2.0.0 — Cloud & Multi-User Release Latest

kyawzayhan26 released this 34 minutes ago

1 commit to main since this release

v2.0.0

35f9015

SDT V2.0.0

SDT V2.0.0 transforms the original local single-user Self Development Tracker into a cloud-hosted, authenticated, multi-user web application.

What's New

Cloud Deployment & Multi-User Access

- Migrated persistence from Microsoft SQL Server to Supabase PostgreSQL
- Deployed the application to Vercel
- Added Supabase Authentication
- Added authenticated user ownership
- Implemented PostgreSQL Row Level Security (RLS)
- Added protected API routes and user-level data isolation

Mobile-Responsive Interface

- Added responsive desktop and mobile layouts
- Introduced compact mobile challenge and calendar views
- Added mobile navigation
- Optimised daily tracking for phone-sized screens

Challenge History

- Added access to completed challenges
- Added historical challenge details
- Added access to previous final reports
- Enforced user ownership for historical data

CASE STUDY OUTCOME

A small product — delivered through a complete change lifecycle.

SDT V2 demonstrates the bridge between Business Analysis and implementation: identify friction, define change, assess impact, redesign the solution, validate it in production and close the release.

ACCESS

Cloud-hosted product

TRUST

Auth + RLS isolation

USABILITY

Mobile + history + notes

ASSURANCE

25/25 UAT passed

EXPLORE THE PRODUCT

Try the production application or review the implementation, BA artifacts and release history.
